

Reference screens — GitHub Web

Source: Mobbin, GitHub Web app · **Captured:** 21 Aug 2026 · **Screens reviewed:** 17

Live style guide built from these: [Stellaris Helper Style Guide](#)

Each screen below links to its Mobbin page. The "What it drove" column is the specific token, component, or rule in the style guide that came out of that screen — so when a spec is questioned later, the evidence is one click away.

1. Repository & file browsing

The closest analogue to the rift browser: a dense list of named items with metadata columns, inside a page with persistent chrome.

Screen	What it drove
Repo file browser with Files sidebar	The two-column shell (content + 296px side rail), the bordered content card with a subtle-grey header strip, and 40px table rows. This is the direct model for the rift list.
Repo home with About sidebar and branch popover	Right-rail metadata pattern (description, links, topic pills, stat rows) — the model for a rift's requirements/restrictions panel. Also the floating-overlay shadow spec.
Repo with branch-protection banner	Flash message anatomy: 1px semantic border, subtle fill, icon, one line of explanation, one action, dismiss. Used for DLC-gating and sync-date notices.
TheAlgorithms/Python — public repo at scale	Topic label pills (12px, pill radius, accent-subtle fill) — the direct source of the reward-type badge. Also the segmented button groups used for filter controls.
File browser with folders and Add file	Icon + name + secondary metadata row rhythm; confirmed 14px as the table body size and 12px for the timestamp column.
Clone dropdown overlay	Overlay elevation, tabbed panel inside a menu, and the warning flash nested inside an overlay. Model for the "how do I reach this reward" popover.

2. Projects — tables, boards and filters

This is where GitHub solves the exact problem your reward finder has: filtering a long typed list and showing state per row.

Screen	What it drove
Projects table view	The filter bar sitting <i>inside</i> the card on canvas.subtle, column headers at 12px muted, and status pills inline in cells. This is the reward

Screen	What it drove
	finder table, almost unchanged.
Projects table grouped by priority	Collapsible group headers with a colored dot and a count — the pattern for grouping rewards by type (Relics 8, Edicts 3, ...).
Projects board view	Card-in-column layout with per-column counts; the card's label row is the ancestor of the rift card's pill row.
Board with an active filter chip	Active-filter treatment: the query stays visible and editable with a count and a clear affordance, rather than hiding behind a "Filters (2)" button.
Issues list — empty state	The empty-state spec: centered icon, 20px heading stating the fact, one sentence offering a way out, one button. Also the Filters + search + primary-action bar.

3. Settings — forms and long-form nav

Screen	What it drove
Public profile settings	Form field anatomy: 14px semibold label, 32px input, 12px muted help text below. Left nav with grouped, labelled sections. Inline error text in danger red directly under the field it belongs to.
Profile form with checkboxes	Checkbox + label + help-text stacking, and the "one primary green button ends the form" rule.
Sponsors settings	Per-field inline Save — worth stealing if rift notes become editable. Also a bordered empty-state panel nested inside a settings section.
Enterprise settings	Two-level left nav (section + sub-items), underline tabs above a form, required-field asterisk, and a full-width trial banner above the app chrome.

4. Dark theme

Screen	What it drove
Codespaces / editor, dark	Dark canvas values and the rule that in dark mode a floating shadow is a 1px ring plus a deep drop — a soft shadow alone is invisible on near-black.
Codespaces, second variant	Confirms dark-mode border contrast (#3d444d) and that dark surfaces step <i>up</i> in lightness as they come forward, the inverse of light mode.

Notes

- **Why there are no image files mirrored here.** Mobbin serves its screenshots from an authenticated CDN, so the files cannot be copied into Drive from this session — only linked. The links above resolve for anyone with a Mobbin account. Four rendered reference sheets (color tokens, type scale, components, rift patterns) were produced alongside this doc and can be dropped into this folder manually.
- **Licensing.** Primer, GitHub's design system, is MIT-licensed and its tokens can be used freely. GitHub's logo, wordmark, and the Octicons brand marks are not — the mark used in the style guide's header is a placeholder and must be replaced before anything ships.
- **What to add next.** The reference set has no pull-request diff view and no command palette. If Stellaris Helper ever gets a side-by-side path comparison or a keyboard-first jump-to-rift, pull those two screens before designing them.
